Documentation

I/ General

Paradoxos Mod Manager is a java application that can be used to manage your mods in recent Paradox Interactive's games: Crusader Kings II, Europa Universalis IV, Stellaris, Hearts of Iron 4 and Imperator Rome.

I developed this app because I often have lots of mods and save games with different lists of mods active in Stellaris, and enabling/disabling the mods of a saved game every time before I launch my game, was getting very boring...

Download

You can download the tool (all versions) from the GitHub repository: https://github.com/ThibautSF/ParadoxosModManagerRework/releases

Version log:

https://drive.google.com/open?id=1DFCgmSFUUZ2IRY-ON1bOVZki9LPd-FSTHacR7i2ibUA

II/ Requirements

- OS: Windows, Linux, macOS
- Supported game(s) and mods installed -> not really necessary but without these, this
 tool won't be very useful

III/ How to use?

About Paradox Launcher v2

The new Paradox Launcher use another file to order all your mods, so even if you apply a list with Paradoxos Mod Manager the Paradox Launcher could show another order than the one you just apply. Don't worry, it should be purely cosmetic.

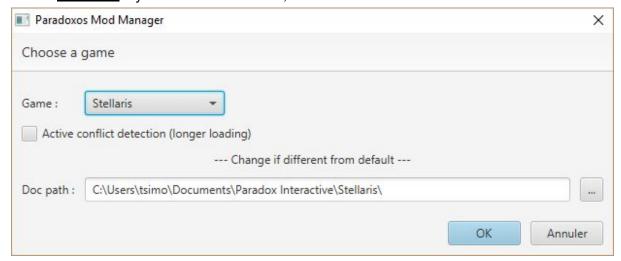

To use a mod list through the new launcher, it is currently recommended to apply a mod list and launch the game immediately afterwards.

Don't change anything in the launcher after it opens, just click the play button. That should preserve the load order generated by Paradoxos Mod Manager.

If you install new mods you will probably need to launch the game launcher first in order to update the game's mod/ folder content.

- 1. Launch the app (execute "LaunchParadoxosModManager")
- 2. Choose your game
- Choose if you want to also generate a list of modified files and conflicts (same file modification) between mods

Attention: If you have a lot of mods, this can take a lot of time!

If your game's document path is different from the default one, you can modify it.

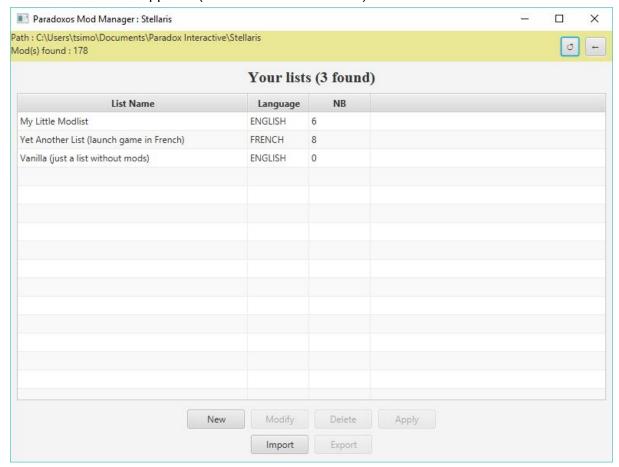

The path is regenerated when you change the selected game!

The app saves for each game the last path used and restores it when you choose a game.

Buttons:

 "..." → Open the system file browser in order to select the directory wanted (you can still copy/paste it in the text input)

4. This window appears (with 0 lists at first launch)

You can see all your lists with the following information: "Name (Number of mods): Game Language".

Buttons:

- "□" → Reload your available mods (and generate conflicts if you choose the option)
- "←" → Back to launch screen (app setting, game selection)
- "New" \rightarrow Open a window to create a new mod list
- "Modify" → Open a window to modify the selected mod list
- "Delete" → Delete the selected mod list
- "Apply" → Apply the selected mod list to the game (edit the file "setting.txt")
- "Import" → Import a list from an XML file
- "Export" → Export the selected list in an XML file

Paradoxos Mod Manager : Stellaris List Name : i Game language : ENGLISH A new list Use custom order (ASCII order otherwise) Description: New order detected: #1 is loaded firstly by the game. You can add a description Thus mods will be applied bottom to top Mod Name # Actions Your mods (270 founds) !Expanded Stellaris Asce... 1 **Mod Name** File !Masters of Nature Alph... 2 ugc_1237501091.mod 1.9.* 🗷 🗷 🛌 IExpanded Stellaris Ascension Perks !Real Space - Planetary ... 3 1 4 x ugc_1622400878.mod 2.2.* !Hands of State (2.2) 0 9 = !Space Rangers 4 ↑ ↓ × !Homeworld Ethics (2.2) ugc 1587475542.mod 2.2.* ((-NSC FRENCH TRADU... 5 0 9 **=** ↑ ↓ × ugc 1376785486.mod 2.1.* !Masters of Nature AlphaModded (-NSC2 Addon: Extra Shi... 6 ↑ ↓ × ugc_1319299098.mod 2.0.* !Real Space - Planetary Diversity Compatibility Patch 2.0 0 9 **=** (-NSC2 Addon: Unlimite... 7 ↑ ↓ × 0 9 5 ugc_1595204335.mod 2.2.* (-NSC2 Season 4-) 8 ↑ ↓ x ... !The Utopian Dream (2.2.6) ugc_1588513621.mod 2.2.* I ((-NSC FRENCH TRADUCTION-)) ugc_912537027.mod 2.3.* ((Guilli's Ship Components NSC Compatibility 2.3 ugc_1359117942.mod 2.3.* 0 0 5 ugc_1439513019.mod (-NSC2 Addon: Extra Shipsets-) 2 2 E ugc_683230077.mod 0 0 - (Xenology : Traits Expansion Reborn) ugc 1323750659.mod 2.3.* uge 1270474221 mod ip: Use shift and ctrl for multiple sele

Reset ASCII order

Import from current

5. If you choose "New" or "Modify": a new window will open

On this window you can edit a mod list:

Set a name (needed)

Clear List Add/Remove All

- Set the game language (default English)
- Add a description (optional)
- Select/unselect your mods
- See potential conflicts (if you activated the option at the game selection)

Cancel Save Save & Close

Order your mod (if you check custom order)

Select mods one by one by clicking the square or you can also select lines with the primary mouse button (you can use the shift and ctrl in order to select multiple lines) then click on the select button above the table list.

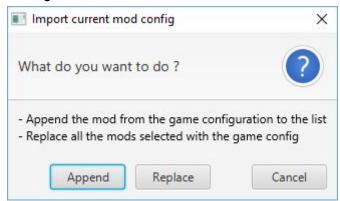

Selected mods are in shown <u>green</u>. Selected mods that have a conflict with (at least) another selected mod are shown in <u>orange</u>. If a mod is missing it will be shown in <u>red</u> and will be removed if you save the list!

If the game uses steam workshop remote ids (like Stellaris and HoI 4) you will be able to open the workshop page of the missing mod with the secondary mouse button.

Buttons:

- "?" → Just a tooltip to remember available mouse actions
- "Clear List" → Clear all selected mods
- "Add/Remove All" → Add all your mods in your list (if all mods are already in, remove the mods from the list)
- "Cancel" → Cancel list edition (close the window without saving)

- "Save" and "Save & Close" → Save list edition (and also close the window); purges all missing mods (in red)!
- "Import from current" → Get your current mod selection from your game's 'settings.txt'

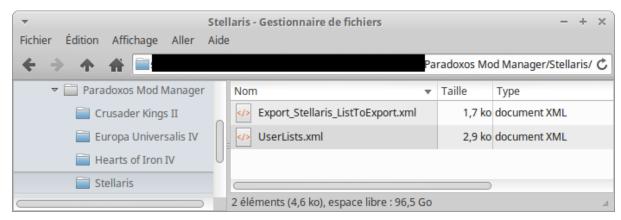

- "Reset (reverse) ASCII order" → set your mod list custom order to use alphabetical order or reverse alphabetical (useless if you don't check "custom order")
- **6.** If you choose "Import" or "Export" (This part will be more useful for Stellaris and Hol4 (because it uses steam workshop) and less for others)
 - a. Export a list

Select the list you want to export and click on "Export".

An XML file will be created in the associated game folder where Paradoxos Mod Manager is installed.

The file name will have the following structure: "Export_{Game}_{ListName}.json" Example: I exported a Stellaris mod list named "ListToExport" with 15 mods activate

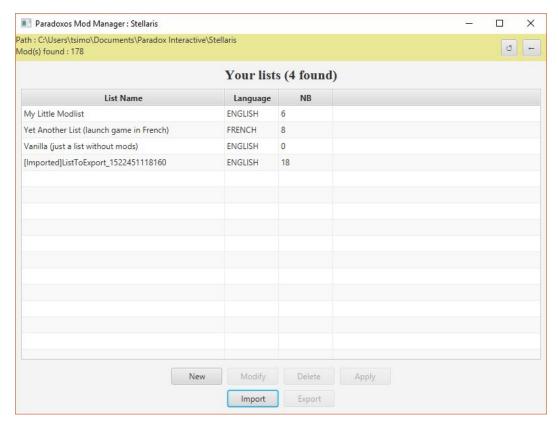

The file "Export_Stellaris_ListToExport.json" can be uploaded and shared with anyone!

b. Import a list

Click on "Import".

Browse for the JSON file of the list you want to import.

And the list is imported! You can now use it (check before if you own all the needed mods: no mod missing).

IV/ Additional Information

I hope you find the application useful and have fun modding your games!

Upgrade ideas & bugs report

Don't forget to report bugs if you find one (often a log file called "DebugLog.txt" is generated).

You can submit bug reports or ideas for improvement in a few ways:

For a bug report: Add all information you can add (OS, java version, image(s), file "DebugLog.txt"...)

- Use one of the presentation thread on the paradoxplaza forum
- Open an issue thread on https://github.com/ThibautSF/ParadoxosModManagerRework/issues
